

Considerations for Autonomous Goal Seeking

Using KEEL[®] Technology

Objective

The objective to create a “system” that can be assigned Goals. The resulting “system” will pursue those Goals while adapting to new information. The “system” will include in its goal-set the concept of “self-value” (a controlled survival instinct). The “system” will be able to accommodate multiple goals at the same time and be able to determine how it allocates resources across its goal-set.

Summary

This is an active development that uses KEEL[®] Technology to interpret situations and adaptively execute prioritized tasks.
